

Chapter - 8 Finding Linux Documentation

* Learning objectives

- use different source of documentation.
- use the man Pages.
- Access the GNY info system.
- use the help command and --help option.
- use other documentation sources.

* Linux Documentation sources

* man

- The man program searches, formats and displays the information contained in the man Page system.
- A given topic may have multiple pages associated with it and there is default order determining which one is displayed when no options or section number is specified.
- To list all pages on the topic, use the `-f` option.
- To list all pages that discuss specific topic (even if the specified subject is not present in the name), use `-is` option.
 - `man -f` generates the same result as `whatis`.
 - `man -is` generates the same result as `apropos`.
- The default order is specified in `/etc/man.db.conf` and is roughly (but not exactly) in ascending order.

* Manual chapters

- The man Pages are divided into chapters number 1 through 9.
- In some cases, a letter is appended to the chapter number to identify a specific topic.
- For example, many pages describing part of the X windows API are in chapter 3X.
- The chapter number can be used to force man to display the pages from a particular chapter.
- with the -q parameter, man will display all pages with the given name in all chapter, one after the other as in

```
$ man -q socket
```

* The GNU info system

ii Using info from the command line

- Typing info with no arguments in a terminal window displays an index of available topics.
- You can browse through the topic list using the regular movement keys: arrows, Page UP and Page Down.
- You can view help for a particular topic by typing <topic name>. The system then searches for the topic in all available info files.
- Some useful keys are: q to quit, h for help and Enter to select a menu item.

* info Page structure

→ The topic which you view in an info page is called a node. The table lists the basic keystrokes for moving between nodes.

→ Items function like browser links and are identified by an asterisk (*) at the beginning of the item name.

→ Named items (out side menu) are identified with double-colons (::) at the end of the item name.

Key	Functions
n	Go to the next node.
p	Go to the previous node
u	move one node up in the index

Table: Keys and Functions

* The --help option

→ most commands have an available short description which can be viewed using --help or the -h option along with the command or application.

→ For example to learn more about the man command you can type.

```
$ man --help
```

→ The --help option is useful as a quick reference and it displays information ~~fast~~ faster than the man or info pages.

* Other Documentation Sources

- Desktop help system.
- package documentation.
- other resources.
